## Lecture 4 - Modular Arithmetic

#### 1 Modulus

A modulus is a system for counting using only the fixed set of integers 0, 1, 2, ..., m - 1. When working in this modulus of m integers, we say that we are working with the integers modulo m.

Let's look at the examples to explore the definition of modulus.

- **Example 1.** The clock below has only five numbers on its face: 0, 1, 2, 3 and 4. The clock has only one hand which moves around the circular face from 0 to 1 to 2 to 3 to 4 and back to 0 in that order. We set the clock to 0 and let it begin ticking clockwise. The first 12 numbers it hits are 1, 2, 3, 4, 0, 1, 2, 3, 4, 0, 1 and 2.
  - (a) To what numbers does the clock point after 20 ticks, after 21 ticks, after 22 ticks, after 23 ticks, after 24 ticks and after 25 ticks?
  - (b) To what number does the clock point after 593 ticks?

**Note.** In this example, we counted using only the 5 integers 0, 1, 2, 3, and 4. We call this system for counting modulo 5.

**Example 2.** Build a 10-row grid of integers according to the following rules:

- Place 4 integers in each row.
- Let 0 be the leftmost integer in the top row.
- For any pair of consecutive integers in a row, make the integer on the right 1 more than the integer on its left.
- Make the first integer in each row after the first row 1 more than the last integer in the previous row.

Your first two rows should look like this:  $\begin{pmatrix} 0 & 1 & 2 & 3 \\ 4 & 5 & 6 & 7 \end{pmatrix}$ 

- (a) Which integers in the grid are in the same column as 0, which in the same column as 1, which as 2 and which as 3?
- (b) If you extend your grid to include a thousand rows, would the integer 3713 be in the same column as 0, 1, 2 or 3?

# 2 Congruence

We say that two integers are congruent or equivalent modulo m when their difference is a multiple of m. Otherwise, they are incongruent in modulo m. For instance, 3713 and 1 are congruent in modulo 4. From the counting grid in example 2, we see that 8 and 28 are congruent in modulo 4 and so are 17 and 33. We use the symbol  $\equiv$  to express congruence and shorten "modulus" to "mod".

$$8 \equiv 28 \pmod{4}$$
 and  $17 \equiv 33 \pmod{4}$ 

Since 25 and 38 do not share the same column, we see that they are incongruent in modulo 4. We write

$$25 \not\equiv 38 \pmod{4}$$
 and  $12 \not\equiv 7 \pmod{4}$ 

In general, we say that

$$a \equiv b \pmod{m}$$

if and only if the number a leaves the same remainder as b when divided by m. In other words, the difference between a and b is a multiple of m.  $\left(\frac{a-b}{m}\right)$  is an integer.)

- **Example 3.** Of the 100 smallest natural numbers, how many are congruent to each of the following?
  - (a) 0 (mod 7), (b) 1 (mod 7), (c) 2 (mod 7), (d) 3 (mod 7), (e) 4 (mod 7), (f) 5 (mod 7).
- **Example 4.** Which of the following integers are congruent to 6 (mod 8)? (a) -18, (b) 54, (c) 754, (d) 1036, (e) 13254.
- Example 5. Arrange the following integers in pairs that are congruent in modulo 12. 3 5 7 8 9 1 26 10 11 68 -97 177 -46 43 238 39 13797 12472102(Hint: Write each of these integers in the form 12n + r whre n and r are integers and  $0 \le r < 12$ .)

### 3 Residue

We say that r is the modulo m residue of a when  $a \equiv r \pmod{m}$  and  $0 \le r < n$ .

- **Example 6.** List all integers between -20 and 20 whose modulo 6 residues are 5.
- **Example 7.** Note that  $207 \equiv 25 \pmod{7}$  and  $25 \equiv 4 \pmod{7}$ . Is it always true that when  $a \equiv b \pmod{7}$  and  $b \equiv c \pmod{7}$ , then  $a \equiv c \pmod{7}$ ?
- **Example 8.** Write each of the following integers in the form 8n + r where n and r are integers and  $0 \le r < 8$ .

(a) 
$$54$$
, (b)  $434$ , (c)  $-23$ , (d)  $-99$ .

**Example 9.** Determine the residue of each of the following within the given modulus. (a)  $71 \pmod{3}$ , (b)  $-14 \pmod{8}$ , (c)  $194 \pmod{11}$ , (d)  $-3944 \pmod{9}$ .

**Example 10.** Look at the following table.

	Column 0	Column 1	Column 2	Column 3	Column 4	Column 5
	6n	6n+1	6n+2	6n+3	6n+4	6n+5
n=0	0	1	2	3	4	5
n=1	6	7	8	9	10	11
n=2	12	13	14	15	16	17
n=3	18	19	20	21	22	23.

Notice that  $1 \equiv 7 \equiv 13 \equiv 19 \pmod{6}$ . Notice also that if we count up 1 from each of those integers, the results are congruent modulo 6:

$$1+1 \equiv 7+1 \equiv 13+1 \equiv 19+1 \pmod{6}$$
.

Let  $a_1$  and  $a_2$  be integers such that  $a_1 \equiv a_2$ .

- (a) Show that  $a_1 + 1 \equiv a_2 + 1 \pmod{6}$ .
- (b) Show that  $a_1 1 \equiv a_2 1 \pmod{6}$ .
- (c) Show that  $a_1 + b \equiv a_2 + b \pmod{6}$ .

**Example 11.** Let  $a_1, a_2, b_1$  and  $b_2$  be integers such that

$$a_1 \equiv a_2 \pmod{m}$$
  
 $b_1 \equiv b_2 \pmod{m}$ .

Show that  $a_1 + b_1 \equiv a_2 + b_2 \pmod{m}$ .

**Example 12.** Note each of the following:

$$6004 = 1000 \times 6 + 4$$
$$603 = 100 \times 6 + 3$$
$$65 = 10 \times 6 + 5$$

Explain an easy way to quickly find the remainder when 6004 + 603 - 65 - 6 is divided by 6.

- **Example 13.** The remainders when two natural numbers are divided by 16 are 11 and 14 respectively.
  - (a) Find the remainder when their sum is divided by 16.
  - (b) Find the remainder when their sum is divided by 8.

## 4 Digit Cycles

To calculate large digit(s) of a number  $a^b$ , a strategy that may work is to just look for a pattern by computing the first few values of  $a^b$  and then seeing that the pattern will repeat for large values of b.

**Example 14.** Find the units digit of  $2^{2023}$ .

### 5 Summary

- For integers a and b, we say that  $a \equiv b \pmod{m}$  if and only if  $\frac{a-b}{m}isaninteger$ . Otherwise,  $a \not\equiv \pmod{m}$ .
- For integers a and b, we say that  $a \equiv b \pmod{m}$  if and only if

$$a = q_1 m + r$$
$$b = q_2 m + r$$

where  $q_1, q_2$  and r are integers and  $0 \le r < m$ .

- For integers a, b and c, if  $a \equiv b \pmod{m}$ ,  $b \equiv c \pmod{m}$ , then  $a \equiv c \pmod{m}$
- For integers  $a_1, a_2, b_1$  and  $b_2$ , if  $a_1 \equiv a_2 \pmod{m}, b_1 \equiv b_2 \pmod{m}$ , then  $a_1 + b_1 \equiv a_2 + b_2 \pmod{m}$ .

## Homework Problems

Homework code: HWN104

Issued on: 30th October 2023

Due date: 1st November 2023

Submit the solutions to at least 6 of the homework problems before the due date.

All of the problems are each worth 5 points.

- 1. How many of the 200 smallest natural numbers are congruent to 1 (mod 9)? List all integers between -200 and 200 whose modulo 9 residues are 1.
- 2. Aung Aung Oo, Aung Aung Htoo and Aung Aung Tun are playing a game of marbles involving first arranging as many piles of 10 marbles as possible. Aung Aung Oo brought 239 marbles, Aung Aung Htoo brought 174 marbles and Aung Aung Tun brought 83 marbles. If all their marbles are grouped together, how many must be removed in order to start the game?
- 3. . Which of the following statements of modular congruence are true and which are false?
  - (a)  $118 \equiv 25 \pmod{13}$
  - (b)  $2701 \equiv 25 \pmod{13}$
  - (c)  $493 \equiv 873 \pmod{10}$
  - (d)  $2401 \equiv 147 \pmod{49}$
  - (e)  $183 \equiv 291 \pmod{6}$
- 4. Determine the modulo 4 residue of the following sum:

$$1+2+3+4+5+6+7+8+9+10+11+12$$
.

- 5. For how many positive integers n, is the remainder 6 when 111 is divided by n?
- 6. Suppose a and b are positive integers, neither of which is a multiple of 3. Find all possible remainders when  $a^2 + b^2$  is divided by 3.
- 7. Ko Sai and Ko Thuta play a game with a pile of 82 toothpicks. The players take turns removing 1, 2, 3, or 4 toothpicks from the pile on each turn. The player that removes the last toothpick loses. Ko Sai goes first. Help him formulate a winning strategy.
